

Volume of a Revolution

Patrick Chen

Nov 13, 2024

The volume of a function rotated around the x-axis is given by:

$$\begin{aligned} \lim_{n \rightarrow \infty} \sum_{i=1}^n \pi f(x_i)^2 \Delta x \\ = \int_a^b \pi f(x)^2 dx \end{aligned}$$

The volume of a function rotated around the y-axis is equivalent to rotating around the x-axis, using the inverse function. The volume is given by:

$$\begin{aligned} \lim_{n \rightarrow \infty} \sum_{i=1}^n \pi f^{-1}(x_i)^2 \Delta x \\ = \int_a^b \pi f^{-1}(x)^2 dx \end{aligned}$$

When finding the volume of a region bounded by two by f and g :

$$\int_a^b \pi f(x)^2 dx - \int_a^b \pi g(x)^2 dx$$

For rotating around any arbitrary horizontal line located at y_0 :

$$\int_a^b \pi (f(x) - y_0)^2 - \pi (g(x) - y_0)^2 dx$$

Average of a function

$$\begin{aligned} f_{avg} &= \lim_{n \rightarrow \infty} \frac{1}{b-a} \sum_{i=1}^n f(x_i) \Delta x \\ &= \frac{\int_a^b f(x) dx}{b-a} \end{aligned}$$

Mean value theorem for Integrals

f is continuous on $[a, b]$, then there exists a number c in $[a, b]$ such that

$$\begin{aligned} f(c) &= f_{avg} = \frac{1}{b-a} \int_a^b f(x) dx \\ \int_a^b f(x) dx &= f(c)(b-a) \end{aligned}$$
