Kinematics and calculus

Patrick Chen

Sept 10, 2024

starting with $v = \frac{dx}{dt}$

$$v = \frac{dx}{dt} \Rightarrow \int v dt = \int \frac{dx}{dt} dt = \int dx = x_f - x_i + x_0$$

The integration constant is x_0

The following relation is how position, velocity and acceleration can be found.

$$x \xrightarrow{\frac{d}{dt}} v \xrightarrow{\frac{d}{dt}} a$$

$$x \xleftarrow{\int dt} v \xleftarrow{\int a} a$$

Motion with non-constant acceleration

to find the change in velocity during the time interval Δt , we can find the area under the $a_x(t)$ curbe

Motion with constant acceleration

When acceleration is constant, the velocity and position formulas can be simplified

$$v(t) = v_0 + \int_0^t a(t')dt'$$

$$= v_0 + a \int_0^t dt'$$

$$= v_0 + at$$

$$x(t) = x_0 + \int_0^t v(t')dt'$$

$$= x_0 + \int_0^t v_0 + at'dt'$$

$$= x_0 + \int_0^t v_0 dt' + \int_0^t at'dt'$$

$$= x_0 + v_0 t + \frac{1}{2}at^2$$
